

Web app with Notifications

1. Scope

Code name: RIN2

An application that allows users to see special posts as a one-time notification.

2. Requirements

- Having a basic user's table (i.e. the one from standard Laravel auth migrations).
 - o Setup the DB, migrate and add some records.
- Adapt and prepare the structure to handle the notifications and identify when a user reads them.
 - o Do the new database migrations for "users" considering that the table is already migrated, seeded and in production.
 - Add the notification switch as not null
 - Add the phone number as nullable
- Have a page to list users and see how many notifications are still to be read.
 - o List user basic info, plus the unread notification count.
 - o Click on a user to "impersonate him" and see a simple home page with the classic notification icon with unread counter on the top-bar.
 - Click on the counter to see the notification list.
 - Click on the notification to set it as read.
- A form to update a user's notifications settings
 - o Switch on-screen notifications on/off
 - o Change Email
 - o Change Phone number
(validated as real mobile number with any free 3rd party library, for example: messagebird)
- A place to post new notifications
 - o Notifications should have
 - a type: marketing, invoices, system
 - a short text
 - an expiration, after which it won't appear on users' pages also if unread
 - a destination: to a specific user or for all
- A list of the posted notifications with detail
- UI look and feel must be consistent and clean

To summarize, the web application should provide a working PoC of:

- o A User settings editor
- o A way to list users and notifications entries with filters.
- o A solution to manually post new notifications items.

Web app with Notifications

3. How to proceed

3.1. How to Work

- Use a local git repository and commit your progress with "atomic commits" and meaningful comments.
- Use PHP 8.2 or greater and Laravel v10 or greater.
- Follow PHP-FIG coding style PSR-1 and PSR-12.
- Use the RDBMS you prefer among Postgres or MySQL.

3.2. How to Report Results

3.2.1. Code

Zip, or tarball, your local project folder including the git meta-data and send it back to us.

3.2.2. Docs and diagrams

Short descriptions of design decisions can be included as .md file in the folder of competence.

We need a comprehensive description of how to install and verify your solution.
